Acknowledgments

This report was prepared by Susan J. Lapham, Africa and Latin America Branch, Center for International Research, under the supervision of Barbara Boyle Torrey, Chief, Center for International Research; Sylvia D. Quick, Assistant Chief, Center for International Research; and Patricia M. Rowe, Acting Chief, Africa and Latin America Branch. Eduardo Arriaga, Special Assistant for International Demographic Methods and Arjun Adlakha, Chief, Asia, Europe, North America, and Oceania Branch also supervised the demographic contents of this report. The staff of the Center compiled the data and prepared the estimates; China Branch: Judith Banister; Africa and Latin America Branch: Paul R. Campbell, Peter D. Johnson, Kevin G. Kinsella, Linda S. Peterson, and John M. Reed; Asia, Europe, North America, and Oceania Branch: Godfrey Baldwin, Martha A. Bargar, Frank B. Hobbs, Mary S. Malachi, Michael K. Roof, and Peter O. Way. Louisa F. Miller, State and National Estimates Branch, Population Division, provided data for the United States and its outlying areas. The assistance during the summer of 1985 of Mark Hardt and Samuel Brown in the preparation of these estimates is appreciated.

Special thanks are due to Josephine M. Babbitt and Yvonne J. Gist for their help in the preparation of graphs for this report and to Deborah A. Kinnaman who edited and typed various drafts of this report. Thanks also are due to our statistical assistants John R. Gibson, Vera Harris-Bourne, Donna V. Hart-Spriggs, Eleanor M. Matthews, Dorothy L. Taylor, Claire R. Warrick; our clerks, Curtis Diggs and Evangeline Johnson; and our computer clerk, Iris Poe for verifying the calculations and entering data into our computerized data base. The assistance of Antwain Merriweather during the summer of 1985 in entering data into the data base is appreciated. We also are grateful to Donna Dove, Carol A. Garner, Carlene Jordan, Lucy Litz, and Janet M. Sales for typing various drafts of the report.

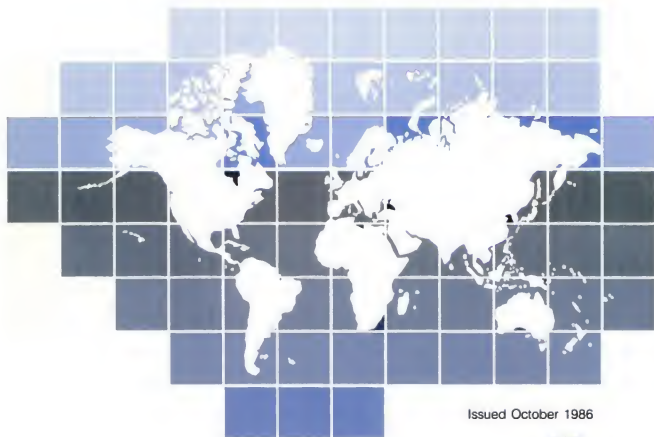

In the Publications Services Division, under the direction of Walter C. Odom, Chief, text and tables were edited by Gail R. Farren; graphics were prepared by David Coontz, Neeland Queen, and Janet Sweeney; and final copy was composed by Gloria Davis.

We are grateful to the staff of the Office of Population, Agency for International Development, for their support throughout various stages of this report, especially Duff Gillespie, Director of the Office of Population, and Elizabeth S. Maguire, Chief of the Policy Development Division and John Crowley, Policy Development Division.

We wish to express our gratitude to the national statistical offices and other national and international organizations worldwide, without whose generous collaboration this kind of report would not be possible. In particular, we are grateful to the United Nations Population Division and Statistical Office, as well as the U.N. regional economic commissions (ECA, ESCAP, and EC-WA), and the Latin American Demographic Center (CELADE) for their cooperation. Numerous individual researchers, both at home and abroad, have also provided considerable assistance in alerting us to data sources and commenting on the estimates.

This report was prepared under a Resources Support Services Agreement with the Bureau for Science and Technology, U.S. Agency for International Development.

Introduction

The population profile of the world has changed substantially in the last 35 years. The world's population has almost doubled; our annual growth rate surged from 1950 to 1964 and now has returned almost to the rate in 1950. There is, however, an enormous inertia in population dynamics. Although our population growth rate has slowed markedly in recent years, more people are expected to be added to the world's population every year through the end of this century. Our future fertility rates will be the major determinant of how large these annual increments to our world will be.

Increasing numbers of us are living in urban areas today than in the past. The continued urbanization of the world will challenge our national planners to provide urban services to almost 50 percent of the world's population in the year 2000. But, our urbanization will also make it easier to distribute public goods, such as health and education, more broadly.

We will also continue to live longer than any of our ancestors, including our parents. Our mortality rates are plummeting; our life expectancy increasing; and our societies aging. Our longer life expectancies may cause new demands for services, but our longevity is one of the major accomplishments of the twentieth century.

This report presents summary demographic data for 205 countries and territories of the world with a population of at least 5,000 in 1985; and estimates and projections for the world and its regions. Of the 205 countries and territories, 160 are classified as developing and 45 as developed. These data are presented for use by U.S. and foreign government agencies, foreign missions, private organizations, businesses, universities, researchers, students, and others with a requirement for a consistent body of recent international population statistics.

The staff of the Center for International Research has collected the most recent official and unofficial data for the 205 countries of the world. The primary sources of the statistical data analyzed in this report are censuses, surveys, and vital registration systems. Population registers, various types of administrative systems, and official estimates also provide some of the data used in deriving the estimates and projections. Most of these estimates and projections are maintained on a computerized system, the International Data Base (IDB), created by the Center for International Research.

There are vast differences in both the quantity and the quality of statistics reported by the various countries. Furthermore, in spite of international recommendations, such as those provided by the United Nations, for the standardization of concepts and definitions pertaining to data collected in censuses and surveys, there are still wide discrepancies in data collection practices because of legitimate differences of what is appropriate in the varying cultural contexts. As a result, any attempt to compile standard data across countries requires consideration about whether and how the reported data should be analyzed, so as to achieve comparability.

Introduction – Continued

The demographic data in this report are based on statistics as reported by the country, as adjusted by other researchers, or as derived by the Census Bureau staffs applying various indirect demographic techniques to incomplete data. All data have been evaluated by the Census Bureau analysts and have been judged to be as representative as possible of the true situation. These data are internally consistent for a given country and are consistent with other facts that are known about the country.

These data have also been checked for external consistency. They have been compared to data for other countries in the same region or subregion, and to those elsewhere at approximately the same level of economic and social development.

In general, information for this publication was obtained from materials available as of August 1985. This report replaces those previously issued in this publication series and it should not be used in conjunction with the earlier reports to derive time series of vital rates or other measures presented.

The information in this publication represents only a fraction of the information that is available at the Center for International Research. Published documents for most of the countries are available at the Bureau of the Census library, and many unpublished documents and computer printouts are included in the data files of the Center for International Research. In addition, the Center staff maintains a regular correspondence with many other persons doing international demographic research, both in this country and abroad. Access to these data, as well as to the detailed notes describing the derivation of any of the estimates published in this volume, is available by addressing specific questions to the Chief, Center for International Research, Bureau of the Census, Washington, DC. 20233. Comments on the estimates are invited.

World Population Trends

1985

Total population	4,865,141,968
Births	128,976,810
Deaths	50,658,994
Absolute population increase	78,317,816
Growth rate (percent)	1.6

World's Population of 4.9 Billion in 1985 Almost Double Its Population in 1950

In 1950, the world's population was 2.6 billion and growing at an annual rate of 1.5 percent. The annual rate accelerated until 1964 and then began to slow. In 1985, the world's population grew at almost the same rate as in 1950, but the number of people who were added to the world in 1985 was 79 million compared to 38 million in 1950.

By Year 2000, World's Population Expected To Be 27 Percent Greater

The world's population is expected to be 6.2 billion by the year 2000, despite an expected decrease in the growth rate. Approximately four persons were born each second in 1985; this is expected to increase slightly to four and one-half births per second by the year 2000.

Fertility and Mortality Rates Declining World Over

Both fertility and mortality rates will be lower in 2000 than they are today; but the world's population will still be growing. The world's population will be better educated, more urbanized, and older than we are today. World trends, however, obscure the dramatic differences in population trends of developed and developing countries.

China

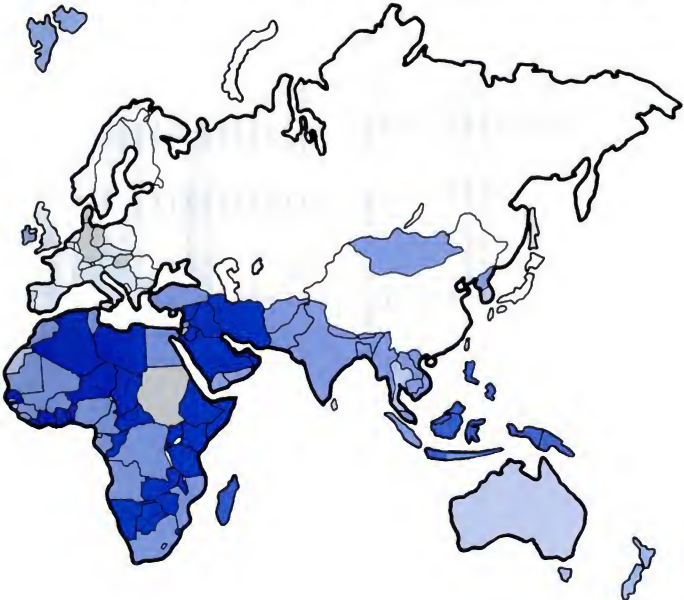

Growth rate (percent)

**Latin America**

Growth rate (percent)

**N. America, Europe, and Soviet Union**

Growth rate (percent)

Growth Rate in China Lower Than Other Developing Countries

Because China's population is such a large proportion of the total population in developing countries, its rate of growth tends to influence the trends for these countries. The average annual growth rate for developing countries increases considerably (from 1.9 to 2.4 percent) when China, with its relatively low growth rate (0.8 percent), is excluded from developing country trends.

Almost Half of World's Population Live in Four Countries

Today, the four most populated countries are China, India, the Soviet Union, and the United States. By the year 2035, Nigeria may surpass the population of both the United States and the Soviet Union to become the third largest country in the world. Almost three-fourths of the world's population live in the 20 largest countries. Of these 20 countries, 13 are in the developing world and all of them, except China, have annual growth rates double those of the developed countries. However, eight of these developing countries have population growth rates today that are lower than they were 10 years ago.

Figure 4.

Absolute Population Increase and Average Annual Rates of Growth, for Developing Countries and Developing Countries Excluding China: 1950 to 2000

Regional Population Trends

	Population, 1985 (millions)	Growth rate, 1985 (percent)
Sub-Saharan Africa	438	3.0
Near East & N. Africa	301	2.7
Asia	2,658	1.5
Latin America	410	2.3
North America	264	0.9
Europe/Soviet Union	769	0.5
Oceania	24	1.2

Sub-Saharan Africa's Growth Rate of 3.0 Percent Twice Growth Rate of Rest of World

Since the late 1970's, Sub-Saharan Africa has generally had the highest population growth rate of any region in the world. It is estimated to have increased steadily from 2.1 percent annually in the 1950-60 period to 3.0 percent in the 1985-86 period. The Sub-Saharan African share of world population will increase from 9 percent in 1985 to an expected 11 percent by the year 2000. Growth rates of 3.0 percent or more mean that the population doubles every 23 years. This is likely to happen in countries such as Botswana, Ghana, Kenya, and Nigeria.

Sub-Saharan Africa's birth rate of 46 per 1,000 population is the highest in the world and 51 percent higher than the average for developing countries as a whole. Sub-Saharan Africa also has the highest death rate of any region in the world.

Sub-Saharan African countries are small to moderate in population size. Nigeria, with an estimated 103 million people, is the only Sub-Saharan African country among the world's 35 most populated nations. Nigeria's population is expected to double by 2009, triple by 2024, and

Figure 5.

Absolute Population Change for 50 Largest Countries: 1975 to 1985

Source: Table 2.

Population change (millions)

quadruple by 2035, adding a total of 312 million people to the world's population in 50 years.

Near East and North Africa's Growth Rates Second Highest Among Developing Regions

Growth rates in the Near East and North Africa have been only slightly lower than those of Sub-Saharan Africa since the late 1970's, making it the second fastest growing region. In 1985, this region had an estimated population of 301 million, approximately 8 percent of the developing world. By 2000, the population is expected to be 443 million, increasing slightly its share of the developing world.

Birth rates in the Near East and North Africa parallel those of Sub-Saharan Africa, although they are slightly lower. This region's birth rate of 40 per 1,000 population is the second highest in the world and 33 percent higher than average for developing countries as a whole. Death rates (12 per 1,000 population for the region in 1985) are significantly lower than in Sub-Saharan Africa, and in fact, are similar to those in many developed countries.

Eight countries in the Near East and North Africa (31 percent of all the countries in the region) are among the world's 50 largest countries. Egypt, Iran, and Turkey are ranked among the top 25 most populated countries.

One of Every Two People Live in Asia

In 1985, Asia had an estimated total population of 2.7 billion, a figure larger than the entire world population in 1950. Today, Asia's people constitute nearly 55 percent of the world population and 69 percent of those living in developing countries. Six of the world's ten most populous countries are in Asia, including the largest two, China and India.

The birth rate in Asia (25 per 1,000 population) is below the world average. The death rate is average

compared with the rest of the world. The population growth rate in Asia is the lowest among the developing regions (except for Oceania); it has declined from a rate of 2.2 percent in 1960-70 to about 1.7 percent in 1980-85. In spite of its moderate population growth rate, more than half of the world's annual population increase takes place in Asia.

Much of the recent reduction in the Asian population growth rate is due to the decline in China. China's growth rate fell dramatically from a peak of 2.7 percent in 1965-70 to an average of only 0.8 percent

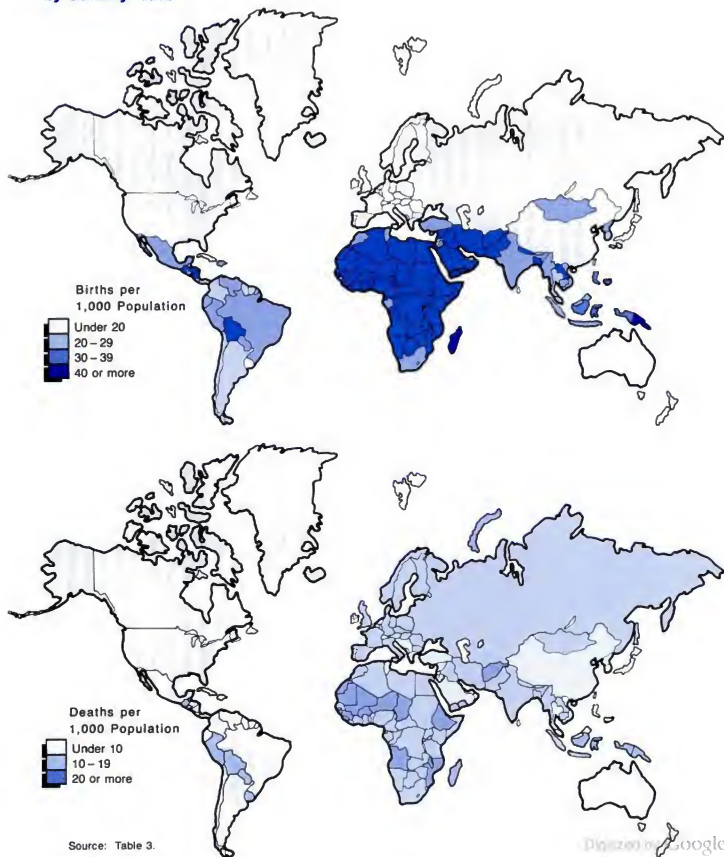

Figure 6.

Population of the World, by Region: 1950, 1985, and 2000

Source: Table 1.

Figure 7.

**Birth and Death Rates
for the World,
by Country: 1985**

Source: Table 3.

during 1985. Nevertheless, because of the large population base of approximately 1 billion people, one in six of the world's births still occur in China.

Growth rates in other Asian countries also have been declining, and the decline is expected to continue at an accelerating rate.

Latin America's Growth Rate Almost Four Times That of Developed World but Steadily Dropping

Latin America's annual growth rate was 50 percent higher than Asia's in 1985. Between 1950 and 1970, its population grew faster than that of any other region. However, since 1950 Latin America's share of the world population increased only slightly. The growth rate of 2.7 percent in 1950-60 remained stable until around 1970 and then dropped to an estimated 2.3 percent during 1975-80. By the year 2000, the population growth rate should be considerably lower than it is today if present trends continue.

Latin America's birth rate is almost the same as the average for developing countries as a whole, while the region's death rate is among the lowest in the world. The disparity of birth rates within Latin America is greater than in any other region of the world. Many Caribbean countries have birth rates approaching the level in developed countries, while countries in Central and South America are at a much higher level (closer to those in Asia). The rate of population growth in Latin America remains above the average for all developing countries and substantially above the world rate of 1.6 percent in 1985.

Only 21 Percent of World Population Live in North America, Europe, and Soviet Union, and Percentage Will Continue to Decline

The lowest rates of population growth between 1950 and 1985 occurred in the developed regions of North America, Europe, and the Soviet Union. Characterized by low fertility and low mortality, this combined area's growth rate has decreased from 1.2 percent in 1950 to 0.6 percent in 1985. Its share of the world population declined from about one-third in 1950 to one-fifth in 1985.

Population Decreasing in Some Developed Countries

There are several European countries whose population is decreasing. These countries include the Federal Republic of Germany, Denmark, Austria, and Hungary. If current fertility trends continue, other European countries also may experience a decline in population during the first half of the next century.

Fertility

Birth rate per
1,000 population
1985

Sub-Saharan Africa	46
Near East and N. Africa	40
Asia	25
Latin America	31
North America	16
Europe/Soviet Union	15
Oceania	21

World's Birth Rate Decreased by 20 Percent Since 1970

Birth rates in Asia have dropped more than in all other regions in the world since 1970. Rates vary from 15 per 1,000 population in Europe and the Soviet Union to 46 per 1,000 in Sub-Saharan Africa.

Birth rates declined in developing countries almost twice as fast as in developed countries. China alone, with one-fourth of the world's population, was responsible for a third or more of the decrease in fertility in developing areas. Chinese fertility fell sharply between 1950 and 1980.

Declines in Fertility Evident in Developing World Since 1970

Fertility is declining in many Asian countries, but levels vary considerably among countries. Long-term declines have brought the birth rate down in the Republic of Korea, Sri Lanka, Thailand, and Indonesia. More recently, fertility also began to fall in India, but it remains at high levels on the rest of the Indian subcontinent. In Bangladesh, Nepal, and Pakistan, fertility has declined only slightly or not at all, and total fertility in these countries still averages six or seven children per woman.

The trend in Latin America is determined primarily by trends in South America, whose 13 countries

Figure 8
**Percent of Births,
by Region:
1970 and 1985**

Source: Table 3 and
U.S. Bureau of the Census, unpublished tables.

constitute about 60 percent of the total population in Latin America. Significant fertility declines in Brazil and Colombia contributed heavily to a decrease in the rate of population growth in the region. Fertility also declined in Venezuela and Peru. In most countries, family planning practices are supported by government policies, with programs in various stages of implementation. Overall, fertility levels in this region

are moderate to low compared with other developing regions.

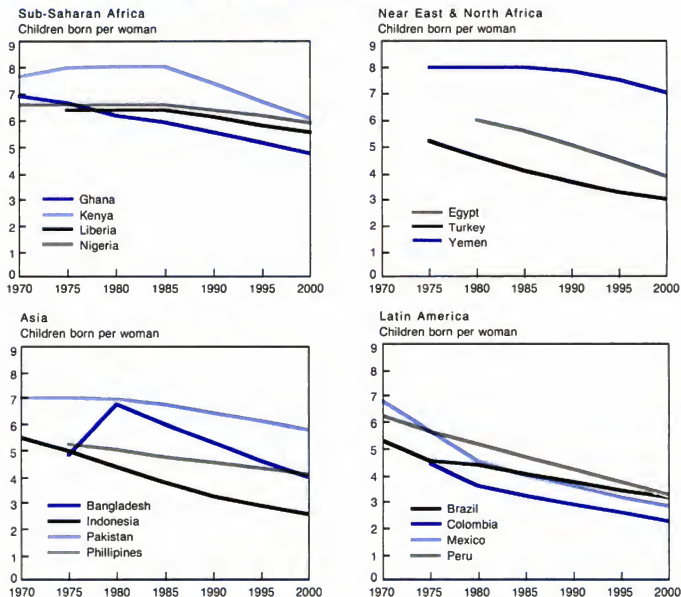

In contrast to many developing countries in other regions, most Sub-Saharan African countries have not experienced declines in fertility. Fertility levels in Sub-Saharan Africa are the highest in the world, with total fertility rates averaging over six children per woman during the past 30 years. In the early 1980's, women had an average of eight

children in Kenya and seven in Senegal; however, these high rates are expected to decline in the near future.

On the average, fertility rates in the Near East and North Africa are lower than in Sub-Saharan Africa, although Yemen (Sanaa) has rates approaching those in Kenya. Turkey and Egypt both have had declines in fertility since 1975. Fertility levels in this region range from five

Figure 9.

Average Number of Children Born to Women, for Selected Countries: 1970 to 2000

Source: Table 6.

children per woman in Morocco and Tunisia to eight children per woman in Yemen (Sanaa).

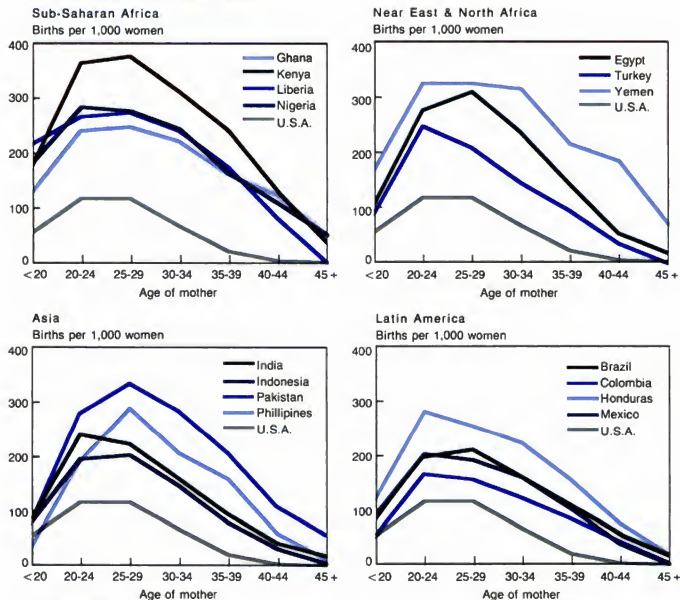

Average Number of Children a Woman Has Ranges from 1.9 in United States to 8 in Kenya

In the early 1800's, White women in the United States had an average of seven children during

their lifetime. The number has decreased steadily since then (except for the "baby boom" period) to an average of 1.9 children per woman. Women in a number of Sub-Saharan African countries have the same number of children that U.S. women used to have (in Kenya, women have eight children). However, women in some Sub-Saharan African countries have just begun to reduce their average number of children.

Most women in other developing regions already have considerably fewer children than do the women in Sub-Saharan Africa. Reduction in the total number of children per woman began in the 1970's and is expected to continue over the next few decades.

Figure 10.
**Fertility Rates, by Age,
for Selected Countries: 1985**

Source: Table 7.

Fertility Falls Below Level of Replacement in Some Developed Countries

During the mid-1970's, fertility began to fall below the level of replacement in some developed countries, and in many countries has remained there. Canada, the United States, and Germany (East and West) have fertility rates under 2.0 births per woman. However, actual population size did not begin to decrease until recently in some of these countries, because most countries of the world experienced an increase in their fertility rate after World War II. As a result, there was a large number of women of childbearing age in the 1970's.

Even with low fertility per woman, the actual number of births per year continued to outnumber deaths.

Fertility Varies Considerably by Age of Mother in Different Regions of World

Most births throughout the world occur to women in their 20's. Relatively high fertility rates are also found in the 30 to 34 age group in developing countries; and over time, the largest declines in fertility tend to occur to women in the 30 to 34 age group.

Use of Contraception

Percent of women using contraception

Egypt, 1984	32
Nigeria, 1981	6
Indonesia, 1980	27
India, 1984	26
Bangladesh, 1983	19
Mexico, 1982	48
Colombia, 1984	55
Thailand, 1984	65
United States, 1982	68

About 45 Percent of Married Women in World Practice Contraception

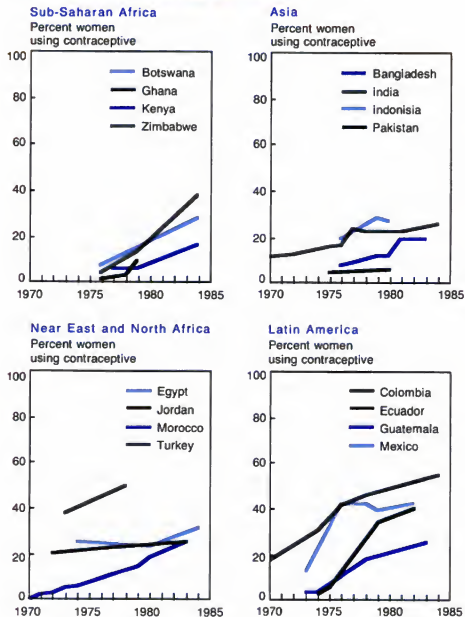

In the early 1980's, married women between 15 and 49 years of age practicing contraception were estimated to be 38 percent for developing countries and 68 percent for developed countries. Estimates of contraceptive prevalence range from approximately 50 percent to over 90 percent in developed countries and from less than 1 percent to over 70 percent in developing countries.

Contraceptive Use Doubled in Many Countries Since 1970

Data for countries that have had two or more surveys suggest that contraceptive use has increased in every region over time. Developing countries with particularly rapid increases in contraceptive use include Ecuador and Mexico in Latin America, Indonesia and Thailand in Asia, Botswana and Zimbabwe in Sub-Saharan Africa, and Morocco and Turkey in the Near East and North Africa. Increased contraceptive use means that couples throughout the world will be more likely to have the number of children they want. Contraceptive use allows couples to space their children, which could lead to a decrease in family size and an increase in family welfare.

Figure 11.

Trends in Contraceptive Use for Selected Countries and Years

Source: Table 5.

Contraceptive Prevalence Varies Widely Among Developing Countries

In Sub-Saharan Africa, very few women practice contraception. Only four countries are reported to have prevalence rates exceeding 25 percent of married women (Botswana, Mauritius, South Africa, and Zimbabwe). Most other countries have less than 10 percent of married women practicing contraception.

In the Near East and North Africa, prevalence rates are generally higher than in Sub-Saharan Africa, but lower than in Asia or Latin America. Almost one-fourth of the countries in the Near East and North Africa are reported to have rates exceeding 25 percent of married women.

Asia has the largest number of women practicing contraception in the developing regions. Almost one-half of Asia's countries have reported prevalence rates of 25 percent or more. Asian countries have the widest range of prevalence rates of any region. Seventy percent or more of married women in China, Hong Kong, Singapore, and Taiwan were practicing contraception in the early 1980's, while less than 10 percent were practicing in Nepal and Pakistan.

Contraceptive prevalence in Latin America is lower than that in East Asia (China, Korea, and Hong

Figure 12.

Contraceptive Prevalence for Selected Countries and Years

Source: Table 5.

Percent currently using contraception

Figure 13

Fertility and Contraceptive Use for Selected Countries and Years

Figure 14

Literacy and Contraceptive Use for Selected Countries and Years

Source: Table 9.

Note: The percent literate for women refers to women ages 15 to 44 years of age as reported in the latest survey or census.

Kong), but is higher than in other developing regions. Over half of the countries in Latin America report prevalence rates exceeding 25 percent of married women; many countries have rates over 50 percent.

Contraception Lowers Fertility

Women who practice contraception tend to have fewer children during their lifetime than those who do not. Women in Liberia and Nigeria have very low levels of contraceptive use and very high fertility rates. Women in Mexico, Indonesia, and Colombia have very high prevalence rates and relatively low fertility rates.

Literacy Associated With Contraception

Women who are well educated tend to practice contraception more and have fewer children than women who have little or no education. Women who have more education also tend to have healthier babies and therefore lower infant mortality rates. Hence, education of women is very important in determining future fertility trends.

Literacy

	Percent literate	
	Male	Female
Burundi, 1979	35	16
Ethiopia, 1981	25	7
Tunisia, 1980	66	39
Morocco, 1982	49	22
Brazil, 1980	69	67
Mexico, 1980	86	79
India, 1981	53	28
Pakistan, 1981	35	16

Literacy Rate of Women Significantly Less Than That of Men in Most Developing Countries

In Sub-Saharan Africa, as in much of the developing world, women, especially rural women, have scant opportunity to learn to read and write. Literacy rates remain below those of other regions with generally less than 20 percent of women being able to read or write.

Many countries in the Near East and North Africa have literacy rates for men comparable to those in East Asia, although there is much variability among countries. Literacy rates for women in the Near East and North Africa generally are at a lower level than those for women in East Asia. In Jordan, half of the women and three-fourths of the men are able to read and write, whereas in Morocco, less than one-fourth of the women and only half of the men are literate.

The classic pattern of literacy in developing countries is seen again in Asia, that is, female literacy rates lower than male literacy rates, although actual levels are higher than in Sub-Saharan Africa. Even so, literacy rates in Asia are highly variable, with the Philippines having rates for men and women of 83

percent and Pakistan having rates of 35 percent for men and only 16 percent for women.

Literacy rates are high throughout Latin America. Although women generally have lower levels of literacy than men, gender dif-

ferences are small in most Latin American countries. Latin American women rank among those women with the highest literacy rates in developing regions. More than two-thirds of both men and women are literate.

Infant Mortality Rates Decreased Faster Than Birth Rates Since 1970

Decreases in mortality rates, especially infant mortality, have generally occurred faster than have decreases in birth rates over the past 20 years. Most developing regions have experienced almost a 25 percent decline in infant mortality rates since 1970 and developed regions almost twice that rate. Many developing countries established family planning programs to encourage a reduction in fertility. These programs, along with maternal and child health programs, have contributed to declines in infant mortality, as well as in fertility.

Over 12 Percent of Babies Born in Sub-Saharan Africa Die Before Age 1 Year

Infant mortality levels in Sub-Saharan Africa are exceptionally high and are likely to remain high for the next 15 years. Infant mortality rates for most Sub-Saharan

African countries are still over 100 deaths per 1,000 live births, and 10 countries have rates exceeding 150 deaths per 1,000 live births. Sub-Saharan African countries averaged 123 deaths per 1,000 live births in 1985. A recent emphasis on the improvement of maternal and child

Figure 16.

Infant Mortality Rates, by Region: 1985

Source: Table 3.

health will likely lead to a decline in infant mortality. High infant and child mortality rates often contribute to high fertility rates, because mothers know that some of their children may die.

Ten Percent of Babies Born in Near East and North Africa Die Before Age 1 Year

Infant mortality levels in the Near East and North Africa are also relatively high, averaging 100 deaths per 1,000 live births. Afghanistan has, by far, the highest infant mortality rate (182 per 1,000 live births), and Egypt, Iran, Sudan, Oman, and the Yemens have higher than average rates for this region. On the other hand, many countries have had quite successful maternal and child health programs and have reduced infant mortality rates dramatically since 1970. Tunisia's current infant mortality rate is 53 deaths per 1,000 live births.

Infant Mortality Rates Declined Significantly in Asia Since 1970

Aside from the Indian subcontinent, most of the countries in Asia have infant mortality rates well below 75 per 1,000 live births; and six countries (Brunei, Hong Kong, Macau, Malaysia, China, and Singapore) have levels comparable to those in Japan and other developed countries. Indonesia and India have similar patterns of infant mortality. These two countries had relatively high rates of infant mortality until the mid-1970's, when mortality began to decline. Pakistan's rate of infant mortality has declined at a much slower rate and is expected to remain above 100 deaths per 1,000 live births beyond the turn of the century.

Infant Mortality Rates in Latin America Lowest in Developing World

The infant mortality rate in Latin America dropped significantly between 1970 and 1985. Most of the decline has occurred since the late 1970's. Even those countries with higher rates tend to be moderate by developing world standards. Only two countries in the region, Bolivia and Haiti, have an infant mortality rate of more than

100. Brazil and Colombia had rates between 75 and 100 in the early 1970's; they have since declined to 64 and 62, respectively, probably because of early efforts in implementing maternal and child health programs. Infant mortality in these two countries is expected to decline to less than 50 deaths per 1,000 live births by the year 2000.

**Infant Mortality Rates
Lowest in North America
and Europe**

North America and Europe have very low infant mortality rates of 10 and 13 per 1,000 live births, respectively. The Soviet Union has a higher infant mortality rate of 31 per

1,000 live births. Infant mortality rates are continuing to decline in these countries as prenatal and perinatal care become more widespread.

Urbanization and Density

Rank	Population of five largest cities (thousands)
1 Tokyo-Yokohama	25,434
2 Mexico City	16,901
3 Sao Paulo	14,911
4 New York	14,598
5 Seoul	13,665

World's Population Urbanizing at Rapid Rate

Until recently, the world had been urbanizing slowly. In 1950, 29 percent of the total world population lived in urban areas; by 1985, that figure rose to 42 percent. By the year 2000, nearly half of the world's population is expected to live in urban areas: 40 percent in developing countries and 78 percent in developed countries¹.

Africa Has Fastest Urbanization in World

Substantial differences exist in the rates of urbanization within developing countries. In 1950, Africa was about 15 percent urban, one of the least urbanized regions of the world. By 1985, it had increased to more than 30 percent urban. Over 40 percent of the population is expected to live in urban areas by the year 2000.

Twenty-eight Percent of Asian People Live in Urban Areas

In 1950, East Asia had an urban population of only 18 percent, but urbanization rose steadily and now the region is over 25 percent urban. Because China accounts for a majority of the total population of

East Asia, its proportions are similar to those of the region as a whole. China was about 12 percent urban in 1950 and was 33 percent urban in 1985. Urbanization in South Asia

increased from 16 percent urban in 1950 to 28 percent urban in 1985. The Near East and North Africa have over 55 percent of their population living in urban areas.

**Cities With 2 Million or More Population:
1950, 1985, and 2000**

Source: Table 12 and U.S. Bureau of the Census, unpublished tables.

Almost 70 Percent of Latin America Urbanized

Latin America was 41 percent urban in 1950, the highest proportion among developing regions; this increased to almost 70 percent in 1985. Urbanization is likely to continue in Latin America, and about 75 percent of the population will live in urban areas by the year 2000.

Bangladesh One of Most Densely Populated Countries in World

Asia is the most densely populated region of the world. Bangladesh, with a density of 1,824 persons per square mile, is the most densely populated country in the world, except for seven small countries (less than 525,000 population) and two city states (Hong Kong and Singapore). The Republic of Korea also has a density of over 1,000 persons per square mile. Europe is the second most densely populated region. Sub-Saharan Africa, the Near East and North Africa, and Latin America all have a density level less than one-fourth that of Europe. Nigeria (250 persons per square mile) is the only large country in these regions approaching the density level of Europe.

Number of Cities With Over 2 Million People Will Double in Next 15 Years

Huge metropolitan cities are a recent phenomenon. The first modern city to reach 2 million was London between 1830 and 1840. At the turn of the century, there were only four cities in the world with more than 2 million people. In 1985, there were 85 cities with populations over 2 million. By the year 2000, there will be an additional 85 cities with populations over 2 million.

The cities with the fastest growth rates at the present time are Lagos, Tehran, Bangalore, and Kinshasa with growth rates between 4.0 and 5.0 percent. In recent years, Mexico City's population grew by about 569,000 per year (3.7 percent), and Sao Paulo and Jakarta each have been growing by more than 3.5 percent annually during the past 5 years. In contrast, Tokyo's annual increase has been about 1.3 percent.

Ten Percent of World's Population Live in Cities With More Than 2 Million People

If all the people who live in cities of 2 million or more were put together, they would constitute a population twice that of the United States. The largest city is Tokyo-Yokohama in Japan, with more than 25 million people in 1985, the same

Figure 21.

Density of Selected Countries: 1985

Source: Table 3.

as Canada's entire population. Mexico City has a population of almost 17 million (almost the same number of people live in all of Venezuela). Third and fourth are Sao Paulo and New York with 14.9 and 14.6 million people, respectively. Seoul and Osaka-Kobe-Kyoto have 14 million people each.

Tokyo-Yokohama Urban Area Largest in World; Mexico City Will Become Largest by 2005

For two decades, from 1950 to 1970, New York ranked first in population size in the world. By 1975 it was overtaken by Tokyo-Yokohama. Based on expected growth rates, Mexico City will pass Tokyo-Yokohama just beyond the turn of the century to become the largest city in the world.

The United States and Canada have 13 of the 85 largest cities, which are home to 23 percent of their combined populations. Among other developed countries, Melbourne and Sydney contain 40 percent of Australia's population; and London, Manchester, and Birmingham contain 28 percent of the United Kingdom's population. Among developing countries, the region that has the highest proportion of persons living in large cities is Latin America. Buenos Aires, Caracas, Lima, Mexico City, and Santiago all contain more than 15 percent of their respective country's population.

Japan	10	20
United States	12	20
China	5	13
Mexico	4	8
Philippines	3	8
India	4	10

Elderly Population Will Increase 46 Percent in Next 15 Years

One of the most significant demographic facts affecting the world is the aging of its population. The number of elderly persons has grown and, for the next 50 years, will continue to grow more rapidly than the total population in most countries. At present, more than 286 million people in the world are 65 years of age or older, a figure that will increase to 418 million by the year 2000. The aging of the world is occurring because of the decline of previously high fertility rates and increases in life expectancy since 1950.

Elderly Proportion of Japan's Population Increasing Faster Than Any Other Country

The transformation of Japanese society to an aged society will be accomplished with a speed not previously experienced by any other country. By 2025, Japan's population will be among the most aged in the world. The elderly proportion of the population of several other countries (Brazil, Mexico, India, Indonesia, and the Philippines) will nearly double between 1985 and 2025.

Figure 23.

Percent of Population Over Age 65 Years, for Selected Countries: 1985, 2005, and 2025

Percent of population over age 65

Elderly Population Likely To Be 13 Percent of Population in China by Middle of Next Century

The elderly are not yet a major share of the population in developing countries; but their numbers are large enough that they cannot be ignored in the future. China's "baby boom" population will be entering their elderly years in the first quarter of the next century creating a huge bulge in the older age groups. The proportion of the elderly population will more than double by 2025.

An aging population may make increasing demands on public sector programs and, therefore, is

sometimes considered a potential problem. Yet, the aging of the world is also a major achievement. Longer life expectancies are associated with both better health conditions and higher literacy. The increasing number of elderly people in a country's population is often also associated with a decline in fertility rates.

While the future aging of the world will create new needs and demands, it will also be a signal of our successes and a new challenge for public policy makers.

Z Represents less than 0.05 percent.

Notes:

AID - Figures supplied by Agency for International Development.

Census - Data taken from census.

CPS - Contraceptive prevalence survey.

DHS - Demographic and health survey.

IPPF - Response to International Planned Parenthood Federation survey of world in family planning.

KAP - Knowledge, Attitude, and Practice of Family Planning Survey.

NSFG - National survey of family growth.

PC - Response to Population Council questionnaire. Data from this source are on program service statistics, sometimes with an estimate for private sector contraceptive practice. Without confirmation from an independent source such as a census or survey, reliance on program service statistics for estimates of contraceptive prevalence may be hazardous.

PRB - Population Reference Bureau.

UNESCAP - United Nations, Economic and Social Commission for Asia and Pacific.

UNK - Source unknown.

SPC - South Pacific Commission.

SS - Service statistics based on number of acceptors or amount of supplies distributed and assumption about discontinuation rates. (See also PC).

Survey - A nationwide survey conducted by a national government or independent organization, but not related to CPS or WFS.

WFS - World fertility survey.

Source - Estimates are from various surveys and other published sources compiled by the U.S. Bureau of the Census (1985, unpublished work tables).

Note. For this table, cities are defined as population clusters of continuous built-up area with a population density of at least 5,000 persons per square mile. The boundary of the city was determined by examining detailed maps of each city in conjunction with the most recent official population statistics. Exclaves of areas exceeding the minimum population density were added to the city if the intervening gap was less than one mile. To the extent practical, nonresidential areas such as parks, airports, industrial complexes, and water were excluded from the area reported for each city, thus making the population density reflective of the concentrations in the residential portions of the city. By using a consistent definition for the city, it is possible to make comparisons of the cities on the basis of total population, area, and population density.

Political and administrative boundaries were disregarded in determining the population of the city. Berlin includes both East and West Berlin, as well as population from East Germany. Detroit includes Windsor, Canada.

The population of each city was projected based on the proportion each city was of its country total at the time of the last two censuses and projected country populations (U.S. Bureau of the Census, 1985). The area expansion of the city was not projected, hence density figures are valid only for 1985.

Table 13.

**Percent of Total Population Over
Age 65 Years, for Selected
Countries: 1985, 2005, and 2025**

Country	1985	2005	2025
United States	12.0	13.1	19.5
Japan	10.0	16.5	20.3
Brazil	4.3	5.8	9.3
Mexico	3.5	4.6	7.7
India	4.3	6.1	9.7
Indonesia	3.5	5.6	8.7
Philippines	3.4	4.2	7.5
China, Mainland	5.3	7.7	12.9
